

AssedGuard AI — Product Brief

Track: 01 — Data Rescue

Team: Solo builder

Date: June 7, 2026

Who it's for

A compliance officer at a mid-size manufacturer preparing for a regulatory audit. Has never opened a database. Works in Excel. Needs answers, not code.

What it does (one sentence)

AssedGuard AI scans a corrupted manufacturing dataset, ranks every data integrity issue by audit risk, fixes what it can automatically, and delivers a plain-English narrative the compliance officer can sign and hand to an auditor.

What success looks like

A compliance officer with zero technical skills uploads a CSV, clicks one button, watches the system work, and downloads a PDF they can submit to a regulator — without asking an engineer a single question.

How it works

Four specialized agents hand off through a shared Cognee memory layer:

1. **Scout** reads the dataset and detects every data-quality issue.
2. **Ranker** prioritizes each issue by regulatory audit risk, with a visible reason for every ranking.
3. **Fixer** auto-corrects what is safe, flags what needs review, and escalates what a human must sign off on — logging a reason for every action.
4. **Narrator** reads the full pipeline memory and writes a signed-ready audit narrative, exported as a professional PDF.

What we are NOT building

- Enterprise SSO or multi-tenant authentication
- Custom database connectors (CSV upload only)
- Real-time monitoring or continuous audit pipelines
